BASIC-ABSTRACT:

The refrigerator had recirculating fans (324) inside the insulated door (2) which draw air in (6) and drive it down through enclosures holding granular material (323) which eliminates odours and transforms volatile emanations from food into e.g. CO₂, providing a dry atmosphere which discourages noxious organisms. The air then leaves through bottom vents (7), so completing its circulation through the cabinet.

The latter contains a case (3), sliding on shelf rails (5). Vertical side channels facilitate air circulation. The case is divided into small food compartments accessed via front doors. Further absorbent granules placed in withdrawable trays within double-skinned perforated compartment ceilings, filter air ventilating the compartment through suitably located inlets and outlets. Front indicators warn when trays need replacement.

ADVANTAGE - Life of refrigerated contents extended and their condition improved.
